

Supplementary Architectural Addendum

Stage 5 Governance - Project 1 Deliverable | Candidate ID: UBI-2026-0158

1. Schema Validation Architecture

To protect the Open Policy Agent (OPA) governance engine against malformed or malicious payload injections, all incoming system ingestion records are subjected to rigid structural validation via **schemas/input-schema.json**. Unmatched data types, missing mandatory keys, or invalid schema definitions are automatically rejected prior to policy evaluation.

Schema Target: /schemas/input-schema.json

Enforcement: Strict Fail-Closed

Validation Tool: JSON Schema Draft-07

2. Cryptographic Provenance & Evidence Binding

All primary testing artifacts and compressed archives are cryptographically bound via SHA-256 fingerprinting. This addendum serves as the architectural reference confirming that runtime decisions executed by **compliance-report.json** mirror the published reference fixtures without unauthorized modification.

Reference Archive Hash:

35401db7422c5a289692ad33b8d0a69d2abcd668379709caa6bfbf38e9948ccb

3. Test Execution Methodology

The automated test suite (**tests/**) executes 18 deterministic evaluation fixtures through Pytest and OPA. Each test verifies a specific compliance rule state, ensuring zero regression across automated pipeline builds and maintaining full alignment with the governance requirements.
